Jacksonville Waterworks 2015 Annual Drinking Water Quality Report

We're pleased to present to you this year's Annual Drinking Water Quality Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our goal is to provide you with a safe and dependable supply of drinking water, and we want you to understand, and be involved in, the efforts we make to continually improve the water treatment process and protect our water resources.

Where Does Our Drinking Water Come From?

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. Our water sources are twelve wells that pump from the Quaternary System Aquifer. Jacksonville Water Works also purchases water from Central Arkansas Water, which receives its supply from two surface water sources, Lake Winona and Lake Maumelle. Both lakes can supply Jackson Reservoir, a regulating reservoir located in Little Rock. Water is delivered by pipeline to the Jack H. Wilson and Ozark Point water treatment plants. Both treatment facilities are located in Little Rock. Jacksonville also purchases water from Lonoke-White Public Water Authority, whose source is Greer's Ferry Lake.

How Safe Is The Source Of Our Drinking Water?

The Arkansas Department of Health has completed Source Water Vulnerability Assessments for Jacksonville Water Works and Central Arkansas Water. The assessments summarize the potential for contamination of our sources of drinking water and can be used as a basis for developing source water protection plans. Based on the various criteria of the assessments, our water sources have been determined to have a low to high susceptibility to contamination. You may request summaries of the Source Water Vulnerability Assessments from our office.

What Contaminants Can Be In Our Drinking Water?

As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include: Microbial contaminants such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; Inorganic contaminants such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming; Pesticides and herbicides which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses; Organic chemical contaminants including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems; Radioactive contaminants which can be naturally occurring or be the result of oil and gas production and mining activities.

In order to assure tap water is safe to drink, EPA has regulations which limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Am I at Risk?

All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. However, some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from small amounts of contamination. These people should seek advice about drinking water from their health care providers. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-426-4791. In addition, EPA/CDC guidelines on appropriate means to lessen the risk of infection by microbiological contaminants are also available from the Safe Drinking Water Hotline.

What is Cryptosporidium?

Cryptosporidium is a microbial pathogen found in surface water throughout the U.S. It lives and reproduces only with the host. In the environment, Cryptosporidium exists as a thick walled oocyst, containing four organisms. Monitoring by Central Arkansas Water in 2015 indicated no presence of these organisms in their Lake Maumelle, Lake Winona, or Jackson Reservoir water sources, and Lonoke - White Public Water Authority in 2015 indicated no presence of these organisms in their Greer's Ferry Lake water source. It is important to know that although filtration removes Cryptosporidium, the most commonly used filtration methods cannot guarantee 100 percent removal. Ingestion of Cryptosporidium may cause cryptosporidiosis, an abdominal infection. Symptoms of infection include nausea, diarrhea, and abdominal cramps. Most healthy individuals can overcome the disease within a few weeks. However, immuno-compromised people are at greater risk of developing life threatening illness. We encourage immuno-compromised individuals to consult their doctor regarding appropriate precautions to take to avoid infection. Cryptosporidium must be ingested to cause disease, and it may be spread through means other than drinking water.

Lead and Drinking Water

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. We are responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.

How Can I Learn More About Our Drinking Water?

If you have any questions about this report or concerning your water utility, please contact Shane Johnson, Production Supervisor, at 501-982-1088. We want our valued customers to be informed about their water utility. If you want to learn more, please attend any of our regularly scheduled meetings. They are held on the fourth Wednesday of each month at 12:00 PM in the Conference Room at 1900 Marshall Road in Jacksonville.

TEST RESULTS

We, Central Arkansas Water and Lonoke-White Public Water Authority routinely monitor for constituents in your drinking water according to Federal and State laws. The test results table shows the results of monitoring done by Jacksonville, CAW and Lonoke-White Public Water Authority for the period of January 1st to December 31st, 2015. In the table you might find terms and abbreviations you are not familiar with. To help you better understand these terms we've provided the following definitions:

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level (MCL) - the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) – unenforceable public health goal; the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) - the highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) - the level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

NA - not applicable

Nephelometric Turbidity Unit (NTU) – a unit of measurement for the clarity of water. Turbidity in excess of 5 NTU is just noticeable to the average person.

Parts per billion (ppb) - a unit of measurement for detected levels of contaminants in drinking water. One part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

Parts per million (ppm) - a unit of measurement for detected levels of contaminants in drinking water.

MICROBIOLOGICAL CONTAMINANTS							
Contaminant	Violation Y/N	Level Detected	Unit	MCLG (Public Health Goal)	MCL (Allowable Level)	Major Sources in Drinking Water	
Total Coliform Bacteria (Jacksonville Water Works)	N	None	Present	0	1 positive sample per month	Naturally present in the environment	
			TURBID	ITY			
Contaminant	Violation Y/N	Level Detected	Unit	MCLG (Public Health Goal)	MCL (Allowable Level)	Major Sources in Drinking Water	
Turbidity(Central Arkansas Water- Ozark Point WTP)	N	Highest yearly sample result: 0.21 Lowest monthly % of samples meeting the turbidity limit: 100%			Any measurement in		
Turbidity (Central Arkansas Water- Jack Wilson WTP)	N	Highest yearly sample result: 0.19 Lowest monthly % of samples meeting the turbidity limit: 100%	MTU	NA	excess of 1 NTU constitutes a violation	Soil Runoff	
Turbidity (Lonoke-White PWA)) N	Highest yearly sample result: 0.31		NA	A value less than 95% samples meeting the li		
		Lowest monthly % of samples meeting the turbidity limit: 99.4%	NTU		of 0.3 NTU, constitutes violation		

Turbidity is a measurement of the cloudiness of water. Central Arkansas Water and Lonoke-White PWA monitor it because it is a good indicator of the effectiveness of their filtration system.

INORGANIC CONTAMINANTS						
Contaminant	Violation Y/N	Level Detected	Unit	MCLG (Public Health Goal)	MCL (Allowable Level)	Major Sources in Drinking Water
Fluoride (Jacksonville Water Works)	N	Average: 0.82 Range: 0.70 - 1.03				
Fluoride (Central Arkansas Water – Ozark Point WTP)	N	Average: 0.74 Range: 0.55 – 0.83	ppm	n 4	4	Erosion of natural deposits; water additive which promotes strong teeth
Fluoride (Central Arkansas Water – Jack Wilson WTP)	N	Average: 0.71 Range: 0.57 – 0.77				
Fluoride (Lonoke-White PWA)	N	Average: 0.73 Range: 0.64 – 0.88	ppm	4	4	Erosion of natural deposits; water additive which promotes strong teeth
Nitrate [as Nitrogen] (Lonoke-White PWA)	N	Average: 0.065 Range: 0 – 0.13	ppm	10	10	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits
Nitrate [as Nitrogen] (Jacksonville Water Works)	N	Average: 0.7 Range: 0.64 - 0.76	ppm	10	10	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits

SYNTHETIC ORGANIC CONTAMINANTS INCLUDING PESTICIDES AND HERBICIDES

Contaminant

Violation Y/N

Level Detected

Unit

(Public Health Goal)

(Public Health Goal)

(Allowable Level)

Leaching from linings of water

(Central Arkansas Water)

N 0.03 ppt 0 200 storage tanks and distribution lines

Contaminant	Number of Sites	90 th Percentile Result	Unit Action Level		Major Sources in Drinking Water
Lead (Jacksonville Water Works)	N N	<0.003	ppm	0.015	Corrosion from household
Copper (Jacksonville Water Works)	N	0.22	ppm	1.3	plumbing systems; erosion of natural deposits

We are on a reduced monitoring schedule and required to sample once every three years for lead and copper at the
customers' taps. The results above are from our last monitoring period in 2014. Our next required monitoring period is in
2017.

TOTAL ORGANIC CARBON

• The percentage of Total Organic Carbon (TOC) removal was routinely monitored in 2015 by our suppliers, Central Arkansas Water, and Lonoke-White PWA and all TOC removal requirements set by USEPA were met. Total organic carbon (TOC) has no health effects. However, total organic carbon provides a medium for the formation of disinfection by-products. These by-products include trihalomethanes (THMs) and haloacetic acids (HAAs).

REGULATED DISINFECTANTS Violation MRDLG MRDL Major Sources in Drinking Disinfectant **Level Detected** Unit (Public Health Goal) (Allowable Level) Y/N Water Chlorine Average: 0.98 Water additive used to control Ν ppm Range: 0.33 - 1.82 (Jacksonville Water Works) microbes

BY-PRODUCTS OF DRINKING WATER DISINFECTION Violation **MCLG** MCL **Level Detected** Unit Contaminant Y/N (Public Health Goal) (Allowable Level) Highest Running 12 Month Average: 21 HAA5 [Haloacetic Acids] Ν 0 60 ppb (Jacksonville Water Works) Range: 11.8 - 33.3 Highest Running 12 Month Average: 53 TTHM [Total Trihalomethanes] N ppb NA 80 (Jacksonville Water Works) Range: 22.7 - **84.1** Average: 228 Chlorite Ν 800 1000 ppb (Central Arkansas Water) Range: 62 - 376 Chlorite Average: 186 ppb 800 1000

While only the upper end of the TTHM range exceeded the MCL, it should be noted that some people who drink water containing Trihalomethanes in excess of the MCL over many years may experience problems with their liver, kidneys, or central nervous systems, and may have an increased risk of getting cancer.

Range: 20 - 368

(Lonoke-White PWA)

	UN	REGULATED C	CONTAMINANTS		
Contaminant	Level Detected	Unit	MCLG (Public Health Goal)	Major Sources in Drinking Water	
Chloroform (Central Arkansas Water- Ozark Point WTP)	11.5				
Chloroform (Central Arkansas Water – Jack Wilson WTP)	31.9	ppb	70	By-products of drinking water disinfection	
Chloroform (Lonoke-White PWA)	Average: 2.31 Range:1.61 - 3.0				
Chloroform (Jacksonville Water Works)	Average: 4.10 Range:0.87 - 7.32				
Bromodichloromethane (Central Arkansas Water- Ozark Point WTP)	2.45				
Bromodichloromethane (Central Arkansas Water – Jack Wilson WTP)	6.33	ppb	0	By-product of drinking water disinfection	
Bromodichloromethane (Lonoke-White PWA)	Average: 1.2 Range:0.85 - 1.46				
Bromodichloromethane (Jacksonville Water Works)	Average: 1.54 Range: 1.01 - 2.07				
Dibromochloromethane (Central Arkansas Water – Jack Wilson WTP)	0.94	ppb	60	By-product of drinking water disinfection	
Dibromochloromethane (Jacksonville Water Works)	Average: 1.55 Range: 1.53 - 1.57				
Bromoform (Jacksonville Water Works)	Average: 1.10 Range: 1.07 - 1.12	ppb	0	By-product of drinking water disinfection	
Strontium (UCMR3) (Central Arkansas Water)	Average: 11.81 Range: 6.6 - 15.7	ppb	Undetermined	Naturally-occurring element; historically, commercial use of strontium has been in the faceplate glass of cathode-ray tube televisions to block x-ray emissions	
Vanadium (UCMR3) (Central Arkansas Water)	Average: 0.48 Range: 0.38 - 0.56	ppb	Undetermined	Naturally-occurring elemental metal; used as vanadium pentoxide which is a chemical intermediate and a catalyst	
Chromium (UCMR3) (Central Arkansas Water)	Average: 0.22 Range: 0.20 - 0.25	ppb	Undetermined	Naturally-occurring element; used in making steel and other alloys; chromium-3 or -6 forms are used for chrome plating, dyes and pigments, leather tanning, and wood preservation	
Chromium-6 (UCMR3) (Central Arkansas Water)	Average: 0.065 Range: 0.041 - 0.104	ppb	Undetermined		
Chlorate(UCMR3) (Central Arkansas Water)	Average: 206.2 Range: 102 - 358	ppb	NA	Undetermined Agricultural defoliant or desiccant; disinfection byproduct; and used in production of chlorine dioxide	

Unregulated contaminants are those for which EPA has not established drinking water standards. The purpose of unregulated contaminant monitoring is to assist EPA in determining the occurrence of unregulated contaminants in drinking water and whether future regulation is warranted. MCLs (Maximum Contaminant Levels) and MCLGs (Maximum Contaminant Level Goals) have not been established for all unregulated contaminants.
